

ANIMALS AND LIFE

WELCOME!

God created many kinds of animals, and some may think that there are animals that do not benefit humans, but may cause them harm, so it is important to remember that God did not create anything in the universe except for wisdom, knowledge of science, ignorance of ignorance. Animals have many benefits that may be mentioned long

Food production

Animals play an important role in achieving human food security and providing them with food directly, including meat, milk and eggs, including fish and marine animals, rich in protein for growth, and indirectly contributing to the provision of plant foods. Role of some animals, such as butterflies, moths, bees, wasps, beetles, bats, and birds. Algae in flower grafting, contributing to increased production of fruit and vegetable crops such as apples, olives, grapes, almonds, tomatoes and sunflow-

er. Animals and the role of some birds, bats, mules, spiders, frogs, wasps, beetles, mosses, vesicles, salamander, dragonfly, nematodes and spiders in controlling the natural pests of agricultural crops

Leather and fur industries

The primitive man used the skins of the animals he had hunted before more than 7000 years. He worked on drying them under the sun, salting them and smoking them to protect them from damage. Over time, the leather industries developed. Leather was used to manufacture many items such as shoes, bags, Clothing, belts, upholstery, gloves, horse-riding and recreational materials. The most important animals to be exploited for their skins are snakes, lizards, crocodiles, cows, bulls, sheep, sheep and horses. To leather use the Some animals, such as sable, chinchilla, kittens, mannek, rabbit, squirrel, fox, lamb, beaver, dill, raccoon, sauerkraut, mink, seal, tiger, tassel, thistle, and wolf are made to make precious fur

coats. In the past, humans used to hunt for their food, to take advantage of leather and fur to make their own clothes, but now fur clothing has become a symbol of wealth. It is obtained from animals caught only in order to obtain their fur in unscrupulous ways, 7] Many laws aimed at curbing the trade in animal furs, especially those that are endangered, have been issued, although international efforts must be more firmly combined to prevent further crimes against animals.

Transport and Labor

Before the invention of the wheel and cars, animals were of great importance in transport, work, and used horses that were quick to ride, tow carts, and used bulls, mules, plows and plows, and also, despite the slow bulls compared to horses and mules, American West to pull closed vehicles, because of its durability, and walking in places with difficult terrain. Mules remain the cornerstone of land transport in many areas, such as rural areas in Latin America, China, and the Sierra Nevada Mountains in Southwest America. In the desert, camels are the best way to travel and travel thanks to their ability

to adapt to desert heat , And sand, and limited quantities of water and food, while the Lama and Albeka was the appropriate means of transport for those living in the Andes, while the elephants, which is characterized by intelligence and endurance, was used to transport heavy loads, and still to the present time used to cut trees with their hose Flex strong. Dogs are the only carnivores humans have been trained to perform many tasks, such as hunting and guarding, and are currently used in snow-ridden areas.

The ecosystem consists of living organisms, non-living materials that exist in a specific place and interlinked. Plants are one of the most important elements of the ecosystem. They represent the food plant in the earth. The solar energy becomes a source of food for humans, animals Every animal, no matter how small, has a vital role in the environment. It is part of the food chain. Despite the great

importance of plants, if it is left to grow without other factors controlling its growth to harm the ecosystem as a whole, the importance of animals that feed on Plants to be harvested Natural predators. Predators, often seen as animals that pose risks to humans and other animals, play a crucial role in keeping the numbers of other animals within normal limits. Animals that feed on birds such as eagles are indispensable for their important role. Cleaning the natural environment, making it more suitable for living human and other living organisms, from the above we can recognize that the extinction of only one species of animals will have successive effects along the food chain, and lead to serious imbalance in nature and the environment.

*Maintaining ecological
balance*

Is one of the living organisms that live on the surface of this earth, and vary in these animals in their forms, sizes, colors, and methods of reproduction, and emerged from the ancient objects of which still exists, and the other part became rodents, as evidenced by the fossil records during the Cambrian explosion before about 542 Almost a million years, and there are many varieties of animals depend on humans since ancient times as a main food to feed on, because of its meat of great nutritional value and useful to the body.

Fish: as jawless, jaw, cartilaginous, shark, bony, and bony, and fin. Amphibians are known as kawasib. Most of these animals have calf skins, not more than 7 mm in

size, such as frogs, thyme, semenders and cecilians. Mammals: They are warm-blooded, medium-to-large in size, from 30 to 30 mm in diameter, such as bats, up to about 30 meters in diameter, and can also be divided into rodents: mice, mice, and beavers. Bats: Bats. Vesicles: the flies, and the mole. Birds are warm-blooded, with more than 10,000 species of birds. The most important thing is that they have wings to fly in the air, but each type of bird can fly at different altitudes. Many of these birds are threatened with extinction.

Wild animals are the group of animals that live on land alone and depend on themselves for food and shelter. They do not live under human care and are an important part of livestock, but they are at greater risk than other animals because they are more prone to Those that live under human protection, many of which are endangered. Wild animals usually live in places far from

human habitation, such as living in forests, desert areas and almost empty areas. They are safer when they live away from humans, because humans have one of the greatest risks, and there are many species Of wild animals we will learn through this article.

wild animals

Birds Birds are a group of inner vertebrates that are internal to the heat, characterized by the presence of feathers on their body and the toothless beak. They have the heart of the four chambers in relation to a light-shaped skeleton and weight. In general, birds are spread throughout the world, including Antarctica known as Antarctica, The birds have wings, some of which are sophisticated and sturdy to fly through, and others are simple because they can not lift the bird in the air for good, and sometimes allow the bird to fly even a short distance, for more information to you this article
